These tables list all of the drinking water contaminants that were *detected* during the most recent sampling for each constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Water Resources Control Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked and explained below.

| TABLE 1 - SAMPLING RESULTS SHOWING THE DETECTION OF COLIFORM BACTERIA |                           |                            |     |      |                              |  |  |  |
|---|---------------------------|----------------------------|-----|------|------------------------------|--|--|--|
| Microbiological<br>Contaminants                                       | Highest No. of detections | No. of months in violation | MCL | MCLG | Typical Source of Bacteria   |  |  |  |
| E. coli   | (in the year)<br>0        | 0                          | (a) | 0    | Human and animal fecal waste |  |  |  |

Routine and repeat samples are total coliform-positive and either is *E. coli*-positive, or system fails to take repeat samples following *E. coli*-positive routine sample or system fails to analyze total coliform-positive repeat sample for *E. coli*.

## TABLE 2 - SAMPLING RESULTS SHOWING THE DETECTION OF LEAD AND COPPER

| Lead and Copper          | No. of<br>samples<br>collected | 90th percentile<br>level detected | No. sites<br>exceeding<br>AL | AL  | PHG | No. of schools<br>requesting<br>lead sampling | Typical Source of Contaminant   |
|--------------------------|--------------------------------|-----------------------------------|------------------------------|-----|-----|---|---|
| Lead (ppb)<br>09/28/23   | 5                              | 3.61                              | None                         | 15  | 0.2 | None  | Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits |
| Copper (ppm)<br>09/28/23 | 5                              | 0.078                             | None                         | 1.3 | 0.3 | Not Applicable                                | Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives               |

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Butte City CSD is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at http://www.epa.gov/lead.

| TABLE 3 - SAMPLING RESULTS FOR SODIUM AND HARDNESS |                |                |                        |      |               |  |  |
|--|----------------|----------------|------------------------|------|---------------|--|--|
| Chemical or Constituent (and reporting units)      | Sample<br>Date | Level Detected | Range of<br>Detections | MCL  | PHG<br>(MCLG) | Typical Source of Contaminant  |  |
| Sodium (ppm)                                       | 03/13/23       | 20.8           |                        | none | none          | Salt present in the water and is generally naturally occurring   |  |
| Hardness (ppm)                                     | 03/13/23       | 96             |                        | none | none          | Sum of polyvalent cations present in the water, generally magnesium and calcium, and are usually naturally occurring |  |

## TABLE 4 - DETECTION OF CONTAMINANTS WITH A PRIMARY DRINKING WATER STANDARD

| Chemical or Constituent<br>(and reporting units) | Sample Date | Level Detected | Range of<br>Detections | MCL<br>[MRDL] | PHG<br>(MCLG)<br>[MRDLG] | Typical Source of Contaminant   |
|--|-------------|----------------|------------------------|---------------|--------------------------|---|
| Nitrate (as nitrogen, N) (ppm)                   | 03/13/23    | 0.6            |                        | 10            | 10                       | Runoff and leaching from fertilizer use;<br>leaching from septic tanks and sewage;<br>erosion of natural deposits |
| Arsenic (ppb)                                    | 03/13/23    | 4.6            |                        | 10            | 0.004                    | Erosion of natural deposits; runoff from orchards; glass and electronics production wastes                        |
| Barium (ppm)                                     | 03/13/23    | 0.03           |                        | 1             | 2                        | Discharges of oil drilling wastes and from metal refineries; erosion of natural deposits                          |
| Chromium [Total] (ppb)                           | 03/13/23    | 2.2            |                        | 50            | (100)                    | Discharge from steel and pulp mills and chrome plating; erosion of natural deposits                               |

## TABLE 5 - DETECTION OF CONTAMINANTS WITH A <u>SECONDARY</u> DRINKING WATER STANDARD

| Chemical or Constituent (and reporting units) | Sample Date | Level Detected | Range of<br>Detections | SMCL | PHG<br>(MCLG) | Typical Source of Contaminant   |  |
|---|-------------|----------------|------------------------|------|---------------|---|--|
| Chloride (ppm)                                | 03/13/23    | 6.0            |                        | 500  | N/A           | Runoff/leaching from natural deposits; seawater influence   |  |
| Specific Conductivity (µS/cm)                 | 03/13/23    | 291            |                        | 1600 | N/A           | Substances that form ions when in water; seawater influence   |  |
| Sulfate (ppm)                                 | 03/13/23    | 13.5           |                        | 500  | N/A           | Runoff/leaching from natural deposits; industrial wastes  |  |
| Total Dissolved Solids                        | 03/13/23    | 175            |                        | 1000 | N/A           | Runoff/leaching from natural deposits   |  |
| Copper (ppm)                                  | 03/13/23    | 0.13           |                        | 1.0  | N/A           | Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives |  |
| Zinc (ppm)                                    | 03/13/23    | 0.01           |                        | 5.0  | N/A           | Runoff/leaching from natural deposits; industrial wastes  |  |

<sup>\*</sup> There are no PHGs, MCLGs, or mandatory standard health effects language for these constituents because secondary MCLs are set on the basis of aesthetics.

## TABLE 6 - DETECTION OF UNREGULATED CONTAMINANTS

| Chemical or Constituent (and reporting units) | Sample Date | Level<br>Detected | Range of<br>Detections | Notification<br>Level | Health Effects Language   |
|---|-------------|-------------------|------------------------|-----------------------|---|
| Hexavalent Chromium (ppb)                     | 10/20/14    | 4.5               |                        | 0.02+                 | Some people who drink water containing hexavalent chromium in excess of the MCL over many years may have an increased risk of getting cancer. |

<sup>+</sup>There is currently no MCL for hexavalent chromium. The previous MCL of 10ppb was withdrawn on 9/11/17.
